SECTION 07400

ROOFING AND SIDING PANELS
06/04

NOTE: Delete, revise, or add to the text in this section to cover project requirements. Notes are for designer information and will not appear in the final project specification.

This section covers aluminum and steel roofing and siding, single-sheet uninsulated and insulated metal panels, and fire-rated metal walls.

This section does not include structural steel girts, metal deck in combination with built up roofing, flashing, fascias, and copings not directly connected with metal roofing and siding work.

Drawings must indicate location and extent of work, design load assumptions, location and span of structural framing, construction details, material thicknesses, and special conditions.

Drawings must also indicate panel dimensions sheet profile, thickness, span between structural supports, wall and roof openings and special framing, color, and required fire-rating.

Drawings must indicate locations and type of closure strip required, flashing installation and wainscot height.

PART 1 GENERAL

1.2 PERFORMANCE REQUIREMENTS

1.2.1 Properties of Sections

Properties of steel roofing and siding sections shall be in accordance with ASTM E 621 and AISI SG-671.

Section properties, including yield point, section modulus, and moment of inertia per foot millimeter of width, shall equal or exceed the required values of section properties.

1.2.2 Allowable Design Stress, Deflection, and Loads

Allowable design stress, deflection, and loads for the metal roofing and siding shall be as follows:

Deflection of metal roofing and siding shall not exceed 1/180 under the indicated total dead and live load.

Resistance to gross uplift shall be [_____] pounds per square foot (psf) pascal for eave overhang, and [_____] psf pascal for other roof areas.

Resistance to wind pressure loading shall be not less than [_____] psf pascal for exterior metal siding.

1.3 SUBMITTALS

NOTE: Review submittal description (SD) definitions in Section 01330 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project. Submittals should be kept to the minimum required for adequate quality control. Include a columnar list of appropriate products and tests beneath each submittal description.

The following shall be submitted in accordance with Section 01330 SUBMITTAL PROCEDURES in sufficient detail to show full compliance with the specification:

SD-02 Shop Drawings

Fabrication Drawings for metal roofing and siding units shall be in accordance with paragraph entitled, "General Information," of this section.

Installation drawings for the following items shall indicate completely dimensioned structural frame and erection layouts, openings in roof and walls, special framing details, construction details at corners, ridges, eaves, building intersections, curbs and flashing, location and type of mastic and metal filler strips, location and erection of subgirts, sandwich walls, and fire-rated walls.

Aluminum Roofing and Siding
Steel Roofing, Siding Sheets and Panels
Flashing and Accessories

SD-03 Product Data

Manufacturer's catalog data shall be submitted for the following items:

- Aluminum Materials
- Steel Sheet Materials
- Subgirts and Formed Shapes
- Closure Materials
- Insulation
- Metal Wainscot
- Fire-Rated Walls
- Galvanizing Repair Paint
- Lead Flashing
- Enamel Repair Paint
- Aluminized Steel Repair Paint

SD-04 Samples

Contractor shall submit three pieces each of the following samples:

- Aluminum Roofing and Siding
- Steel Roofing, Siding Sheets and Panels
- Fasteners
- Metal Closure Strips, 10 inches 250 millimeter long of each type
- Sandwich Wall, 8 by 11 inches 200 by 280 millimeter
- Insulation, approximately 8 by 11 inches 200 by 280 millimeter

Contractor shall submit three pieces each of the different color panels used in design for this contract, approximately 4 by 4 inches 100 by 100 millimeter. Color shall be selected in accordance with the various applications for steel roofing, siding, flashing, fasteners, calk and sealants, and repair paint as specified in the design.

SD-06 Test Reports

Test reports for the following shall be submitted in accordance with the referenced articles in this section.

Leakage Tests

Coatings and base metals of metal roofing and siding type of test as specified in paragraphs entitled, "Aluminum Materials" and "Steel Sheet Materials," and in various referenced standards in this section.

SD-07 Certificates

Certificates shall be submitted for the following items showing conformance with referenced standards contained in this section.

- Fasteners
- Galvanizing Repair Paint
- Enamel Repair Paint
- Aluminized Steel Repair Paint
- Fire Rated Wall Construction
- Gypsum Wallboard

1.4 QUALIFICATIONS FOR WELDING WORK

Welding procedures shall be in accordance with AWS D1.1/D1.1M.

Operators shall be permitted to make only those types of weldments for which each is specifically qualified.

1.5 DELIVERY, HANDLING, AND STORAGE

Metal roofing and siding shall be carefully handled at all times to prevent damage to the surfaces, edges, and ends. Contractor shall be responsible for arrangement with the manufacturer for adequate packaging and protection during shipment and offsite storage. Upon arrival at the job site, the sheets shall be checked for damage, dampness, and wet storage stain.

Moisture shall be removed from dampened or wetted sheets. Sheets not immediately used in the work shall be stored and protected in a covered, dry location that provides good air circulation free from effects of moisture and other corrosive environments. Sheets found with damage or stain shall not be used in the work.

1.6 FIELD MEASUREMENTS

Field measurements shall be taken prior to preparation of drawings and fabrication.

1.7 GENERAL INFORMATION

Fabrication Drawings for metal roofing and siding units shall indicate material, thickness, width and length, and any special miter or bevel cuts.

PART 2 PRODUCTS

2.1 ALUMINUM MATERIALS

2.1.1 Aluminum Roofing and Siding

Aluminum roofing and siding shall be continuous, roll-formed sheets, Alclad 3004-H36 alloy, with a minimum ultimate tensile strength of 34,000 pounds per square inch (psi) 235 Megapascal and a minimum yield strength of 30,000 psi 207 Megapascal, and shall conform to ASTM B 209/B 209M and AA ASD1.

Aluminum roofing sheets shall be of sufficient length to bridge at least three spans plus the required end lap. Siding sheets shall extend full height of walls without horizontal joints.

[Finish of sheets shall be manufacturer's standard stucco embossed pattern.]

[Finish of sheets shall be low specular gloss finish.]

2.1.2 Exterior Sheets

[Sheets shall be corrugated aluminum, 2.67 inch pitch by 7/8 inch depth, 0.032 inch 68 millimeter pitch by 22 millimeter depth, 0.81 millimeter thick.]

[Sheets shall be ribbed aluminum, 4 inch pitch by 1 inch depth, 0.040 inch 100 millimeter pitch by 25 millimeter depth, 1.0 millimeter thick.]

[Sheets shall be ribbed aluminum, 8 inch pitch by 1 inch depth, 0.040 inch 200 millimeter pitch by 25 millimeter depth, 1.0 millimeter thick.]

[Sheets shall be V-beam aluminum, 4-7/8 inch pitch by 1-3/4 inch depth, 0.040 inch 124 millimeter pitch by 45 millimeter depth, 1.0 millimeter thick.]

[Sheets shall be vertical, ribbed or fluted architectural pattern.]

2.1.3 Interior Sheets

**NOTE: Select one of the following two paragraphs,
when insulated construction with inner sheets is
required.**

[Interior sheets shall be corrugated aluminum sheets, 2.67 inch pitch by 7/8 inch depth, 0.024 inch 68 millimeter pitch by 22 millimeter depth, 0.61 millimeter thick.]

[Interior sheets shall be vertical, ribbed or fluted architectural pattern aluminum sheets.]

2.1.4 Insulated Panel Construction

Insulated panel construction shall be composed of the specified exterior and interior aluminum sheet erected in accordance with manufacturer's printed instructions. Insulation shall be of thickness and density required.

2.1.5 Flashing and Accessories

Field-formed flashing, corners, closers, fillers, and aluminum expansion joints shall be flat aluminum sheet, 0.040 inch 1.0 millimeter thick, same finish and alloy as specified for roofing and siding, except that temper may be Alclad 3004-0 annealed temper.

Preformed aluminum sheet flashing for corrugated sheet and plain-ridge rolls shall be 0.032 inch 0.81 millimeter thick Alclad 3004-0, same finish as the specified roofing and siding.

2.2 STEEL SHEET MATERIALS

2.2.1 Steel Roofing, Siding Sheets and Panels

Roofing and siding sheets and panels shall be roll formed to the specified profile, thickness and depth as indicated. Material shall be plumb and true, and within the tolerances listed in ASTM A 525. ASTM A 525M.

Flashings, dormers, closers, fillers, metal expansion joints, ridge rolls, and other sheet metal accessories shall be factory-formed material of the same type and quality finish as specified for roofing and siding sheets, and shall be not less than 0.0239 inch 0.61 millimeter thick.

Roofing sheets shall be of sufficient length to bridge at least three spans plus the required end lap. Siding sheets shall extend full height of walls, without horizontal joints.

Roofing material, before coating, shall be not less than 0.0299 inch 0.76 millimeter thick. Siding material, before coating, shall be not less than 0.0239 inch 0.61 millimeter thick.

2.2.2 Profile of Sheet

[Profile shall be corrugated pattern, 2.67 inch 68 millimeter pitch by [9/16] [7/8] inch [14] [22] millimeter depth, thickness.]

[Profile shall be ribbed corrugated pattern, 4 inch pitch by 1 inch depth, 1-5/8 inch top flat and 1-3/8 inch 100 millimeter pitch by 25 millimeter depth, 41 millimeter top flat and 35 millimeter bottom flat.]

[Sheet profile shall be ribbed corrugated pattern, 8 inch pitch by 1 inch depth, with 5-5/8 inch top flat and 1-3/8 inch 200 millimeter pitch by 25 millimeter depth, 143 millimeter top flat and 35 millimeter bottom flat.]

[Profile shall be V-beam corrugated pattern, 4-7/8 inch pitch by 1-3/4 inch depth with 3/4 inch 124 millimeter pitch by 45 millimeter depth, with 19 millimeter top and bottom flat.]

[Profile shall be fluted architectural pattern, 12 inches wide by 1-1/2 inches 300 millimeter wide by 38 millimeter deep, profile and thickness as indicated, and with continuous interlocking ribs at the side joints.]

[Profile shall be vertical, ribbed or fluted architectural pattern.]

2.2.3 Side Laps

NOTE: Delete paragraph heading and following two paragraphs if architectural pattern fluted sheets are selected.

When corrugated pattern sheets are required, select the type of side lap application.

[Side joint laps shall be manufacturer's standard lapped joint for the specified corrugation profile, sealed, and then fastened with sheet metal screws.]

[Side joint lap shall be a factory-formed, interlocking side joint, formed with a standing seam side lap, approximately 1-1/2 inches 38 millimeter high, and with a factory-applied joint seal.]

2.2.4 Insulated Panel Construction

NOTE: Delete paragraph heading and following paragraphs if sandwich or insulated metal wall construction is not required.

When insulated sandwich wall construction with an interior steel sheet is required, select first paragraph.

[Panel shall consist of an exterior and interior steel sheet of profile and coating specified with insulation of thickness indicated. Panels shall be secured in accordance with manufacturer's instructions.]

[Panel shall consist of an exterior steel sheet of profile and coating specified with insulation of thickness indicated. Panels shall be secured in accordance with manufacturer's instructions.]

**NOTE: Select one of the following five categories
of coated steel for steel roofing and siding of the
required quality and durability.**

2.2.5 Zinc-Coated Steel

Roofing and siding sheets shall be fabricated from hot-dip-galvanized steel conforming to ASTM A 446/A 446M, Grade A, and corrugation dimensions and profile as specified. Sheets shall be coated in accordance with ASTM A 525, ASTM A 525M, G90.

2.2.6 Aluminum-Coated Steel

Roofing and siding sheets shall be fabricated from aluminum-coated steel sheets conforming to ASTM A 463/A 463M, Type II, and furnished in the profile specified. Steel shall be cold-rolled, low-carbon steel conforming to ASTM A 606, ASTM E 621 and AISI SG-671. Coating shall be 99 percent commercially pure aluminum with a maximum of 1 percent silicon plus iron. Coating shall be hot-dip applied to both sides of the steel sheet to a total of at least 1 ounce 300 gram of aluminum per square foot meter of surface, both sides, and a total thickness of at least 2 mils. 0.051 millimeter.

2.2.7 Baked-Enamel-Coated Steel

Roofing and siding sheets shall be enamel-coated, hot-dip galvanized steel conforming to ASTM A 446/A 446M, Grade A. Corrugation dimensions and profile shall be as specified. Sheets shall have a coating in accordance with ASTM A 525, ASTM A 525M, G90.

Pretreated steel shall be given a two-coat, baked-on, thermo-setting acrylic enamel, alkyd melamine, or vinyl-solution finish with a minimum dry-film thickness of 1 mil. 0.025 millimeter.

Roofing sheets and siding sheets exposed on one side only, shall have finish coat one side and standard wash coat on the reverse side. Siding sheets exposed on two sides shall be finish coated on both sides. Color of sheets shall be as selected from manufacturer's standard colors.

2.2.8 Porcelain-Enamel-Coated Steel

Roofing and siding sheets shall be porcelain-enamel-coated steel sheets conforming to PEI 1001. , above 427 degrees C, using ASTM C 286, with panel tolerances not to exceed 5 millimeter convex and 3 millimeter concave on 0.75 square metal panels. Sheets shall be "enameling iron or steel" of low metalloid and copper content, conforming to ASTM A 424, or commercial quality, cold-rolled sheets conforming to ASTM A 366/A 366M; with the added requirement that steel sheet shall have a medium skin pass and can be satisfactorily porcelain enameled.

Porcelain-enamel coating shall consist of not less than two coats fused to both sides and edges of each sheet at not less than 1,450 degrees F. 788 egrees C. Finish coat shall be 0.010 inch 0.25 millimeter thick, minimum. Unexposed surface of the sheet shall be coated to the same thickness as the exposed surface with either the finish coating or a slurry coating.

Finish Color of porcelain-enamel coating shall be as follows:

[Selected from manufacturer's standard colors, and shall match the indicated PEI color number and the approved sample.]

[Selected from manufacturer's custom matte decorator colors, and shall match the approved sample.]

2.2.9 Protected Metal

At the option of the Contractor, and in lieu of the zinc-coated non-asbestos felt protection specified, metal sheets shall be commercial-quality galvanized steel sheets conforming to ASTM A 446/A 446M, Grade A, coating designation ASTM A 525, ASTM A 525M, G90. After zinc coating, the sheets shall be heated and coated with adhesive. After the coated sheet has been cured, two separate coats of a weather-resistant and chemical- and fume-resistant protective bituminous compound shall be applied. Immediately after the second protective bituminous compound coat has been applied, a layer of mica shall be applied to both sides of the sheet under heat and pressure. Total dry-film thickness of bituminous compound and mica shall be not less than 25 mils 0.635 millimeter and shall average 30 mils. 0.762 millimeter. Mica-coated sheets shall be uniform in appearance; nonuniform appearing sheets will be rejected. Dry-film thickness of color coating shall be not less than 0.006 inch 0.152 millimeter and shall provide complete hiding to the extent that the application of additional paint will not cause a change in color.

2.3 SUBGIRTS AND FORMED SHAPES

Panel subgirts, T-bars, Z-bars, and angle closers shall be die-formed shapes fabricated from steel conforming to ASTM A 36/A 36M, hot-dip galvanized in accordance with ASTM A 525, ASTM A 525M, G90.

Die-formed subgirts shall have a minimum uncoated thickness of 0.0478 inch (No. 18 U.S. standard gage) 1.2 millimeter and bar shapes shall be at least 1/4 by 1 inch. 6.4 by 25 millimeter. T-bars shall have a minimum uncoated thickness of 0.0299 inch (No. 22 U.S. standard gage) 0.76 millimeter and Z-bars shall have a minimum uncoated thickness of 0.0747 inch (No. 14 U.S. standard gage). 1.9 millimeter.

Concealed clips shall be fabricated from hot-dip-galvanized steel conforming to ASTM A 366/A 366M, coating designation ASTM A 525, ASTM A 525M, G90.

2.3.1 Galvanized Steel Angles

Galvanized steel angles shall be hot-rolled carbon steel conforming to ASTM A 36/A 36M, and hot-dip galvanized in accordance with ASTM A 123/A 123M.

2.3.2 Electrodes for Manual, Shielded Metal Arc Welding

Electrodes for manual, shielded metal arc welding shall meet the

requirements of AWS D1.1/D1.1M, and shall be covered, mild-steel electrodes conforming to AWS A5.1.

2.4 FASTENERS

NOTE: Fasteners can be correlated English to Metric using ISO 261, ISO 262, Metric Screw Threads Plan and Sizes, and ISO 263, Inch Screw Threads Plan and Selection.

Exposed fasteners for securing sheets to structural steel framing or to subgirts shall be No. 14 M6 by 0.75 self-tapping, Type B, recessed hexagon-head, Type 305 corrosion-resistant steel screws with cadmium-plate finish; length as required for the application. Fastener assembly shall include a corrosion-resistant steel washer and a neoprene washer, or an integral corrosion-resistant steel and neoprene washer. Exposed head of fastener shall match Color of roofing and siding sheets by means of plastic caps or factory-coated heads.

Exposed fasteners for securing overlap-type side laps of corrugated profile steel materials, and for securing accessory steel flashing, shall be No. 14 by 3/4 inch M6 by 0.75 by 20 millimeter long Type B recessed hexagon-head, Type 305 corrosion-resistant, chromium-nickel-steel screws with corrosion-resistant steel and neoprene washers. Screw head caps shall match color of sheets.

Exposed fasteners for securing sidelaps of aluminum sheets and for securing aluminum flashing to roofing and siding sheets, shall be No. 12 by 3/4 inch M5 by 0.5 by 20 millimeter long, slotted pan-head Type A aluminum, sheet metal screws with aluminum and neoprene washers.

2.5 CLOSURE MATERIALS

2.5.1 Mastic Closure Strips

Mastic closure strips shall be closed-cell, expanded cellular rubber conforming to ASTM D 1056, Type S, Class SCE-41 CMP. Closure strips shall be cut or premolded to the exact configuration of the specified roofing and siding material.

Closure strips shall be uniform in appearance, free of weak sections, bubbles, cracks, and defects.

2.5.2 Adhesives for Closure Strips

Adhesive for use with closure strips shall be the type recommended and furnished by the closure strip manufacturer.

2.5.3 Metal Closure Strips

Metal closure strips shall be factory fabricated accessories matching the type, thickness, and corrugation profile of the specified roofing and siding. Aluminum closure strips shall be mill-finish aluminum, Alclad 3004-H36, not less than 0.032 inch 0.813 millimeter thick. Steel closure strips shall be the same thickness and finish as the exterior roofing and siding panels.

2.5.4 Joint Sealants

2.5.4.1 Sealants

Sealants shall be an approved gunnable type for use in hand- or air-pressure calking guns at temperatures above 40 degrees F 4 degrees C (or frost-free application at temperatures above 10 degrees F minus 12 degrees C). They shall be used around doors, windows, masonry, and other construction material. Solids content shall be a minimum of 85 percent of the total volume. Sealant shall dry with a tough, durable surface skin which permits it to remain soft and pliable underneath, providing a weathertight joint. No migratory staining shall be permitted on painted or unpainted metal, stone, glass, vinyl, or wood.

Joints shall be primed with a compatible one-component or two-component primer as recommended by the sealant manufacturer.

2.5.4.2 Shop Applied

Sealant for shop-applied calking shall be an approved gun grade, nonsag one-component polysulfide or silicone conforming to ASTM C 920, Type II, and with a curing time to ensure the sealant's plasticity at the time of field erection.

2.5.4.3 Field Applied

Sealant for field-applied calking shall be an approved gun grade, nonsag one-component polysulfide or two-component polyurethane with an initial maximum Shore A durometer hardness of 25, and shall conform to ASTM C 920, Type II. Color shall match panel colors.

2.6 INSULATION

Insulation shall be semirigid glass-fiber insulation board conforming to ASTM C 553, Form A, Class 1, Class A fire-hazard classification with a minimum density of 1.55 pounds per cubic foot (pcf), and 1-1/2 inches 24.8 kilogram per cubic meter, and 38 millimeter thick. Thermal conductivity (K) shall be not more than 0.24. 0.42 watt per meter per degree K.

Insulation shall be rigid glass-fiber insulation conforming to ASTM C 553, Form A, Class 1, Class A fire-hazard classification with a minimum density of 6 pcf, and 1 inch 96 kilogram per cubic meter, and 25 millimeter thick. Thermal conductivity (K) shall be not more than 0.22. 0.38 watt per meter per degree K. Insulation shall have a factory-painted, glass-mat surface on the exposed side.

Insulation shall be a mineral fiber insulation conforming to ASTM C 553, Form A, Class 1, Class A fire-hazard classification, with a minimum density of 6 pcf, and 1 inch 96 kilogram per cubic meter, and 25 millimeter thick. Thermal conductivity (K) shall be not more than 0.22. 0.38 watt per meter per degree K. Insulation shall have factory-applied, UL rated, 0.0025 0.0635 millimeter aluminum-foil facing on the exposed surface.

2.7 METAL WAINSCOT

Sheet metal wainscot shall be aluminum alloy 3003-H154, stucco embossed E-5 pattern in accordance with ASTM B 209/B 209M.

Sheet metal wainscot shall be hot-dip galvanized steel conforming to ASTM A

446/A 446M, Grade A. Coating shall conform to ASTM A 525, ASTM A 525M, G90, and shall have a two-coat baked-on, [thermosetting acrylic enamel] [alkyd melamine] [vinyl solution finish] with a minimum dry-film thickness of 1 mil. 0.025 millimeter.

2.8 FIRE-RATED WALLS

2.8.1 Materials

Materials for fire-rated wall construction shall be as follows:

Wallboard shall be UL labeled, and listed 40 U18.23 UL Bld Mat Dir fire-retardant Gypsum Wallboard conforming to FS SS-L-30, Type III, Grade X, Class 1, Form c, Style 3, 48 inches 1200 millimeter wide by 1/2 inch 13 millimeter thick by maximum practical length.

Impaling clips, accessories, and fasteners shall be UL listed 40 U18.24 UL Bld Mat Dir galvanized steel sheet or impaling bolts welded to each wall unit joint and spaced not more than 48 inches 1200 millimeter on center.

Bar subgirts shall be 1-1/2- by 1/8 inch 38 by 3 millimeter galvanized steel with slotted holes for welding to end of impaling clip spikes.

Structural angles and flashing angles shall be galvanized steel, gage or thickness as indicated, or material as specified. Flashing angles shall be not less than No. 18 U.S. standard gage 1.3 millimeter thick.

[Facing panels shall be aluminum, E-5 stucco embossed finish.]

[Metal facing shall be hot-dip galvanized steel conforming to ASTM A 446/A 446M, Grade A. Coating shall conform to ASTM A 525, ASTM A 525M, G90.]

[Metal facing shall be indicated and fabricated of enamel-coated hot-dip galvanized steel conforming to ASTM A 446/A 446M, Grade A. Coating shall conform to ASTM A 525, ASTM A 525M, G90. Finish shall have a Class A fire hazard classification. Flame spread, fuel contributed, or smoke developed shall not exceed a value of 25.]

2.8.2 Fire-Rating

**NOTE: Refer to UL building material directory UL
Bld Mat Dir 40 UL 8.24 for fire rated assemblies.**

Fire Rated Wall Construction for fire-retardant partition shall be a UL design, [2] [3]-hour-rated, [aluminum] [steel]-faced partition, constructed in accordance with the indicated details and the roofing and siding manufacturer's instructions.

2.9 FABRICATION OF METAL PANELS

Manufacturer's standard product fabrication and details shall be provided. Flat and curved panels shall be provided as required.

System components shall be factory fabricated ready for field installation.

2.10 REPAIR OF FINISH-PROTECTED MATERIALS

2.10.1 Galvanizing Repair Paint

Galvanizing repair paint shall be a high-zinc-dust content paint, compatible with the specified galvanized-finish roofing and siding material, and shall conform to ASTM A 780.

2.10.2 Enamel Repair Paint

Repair paint for color finish enameled roofing and siding shall be compatible paint of the same formula and Color as the specified finish furnished by the roofing and siding manufacturer.

2.10.3 Aluminized Steel Repair Paint

Repair paint for aluminized steel shall be an acrylic paint conforming to MS MIL-P-28578.

**NOTE: Delete paragraph heading and following
paragraph if lead flashing for mechanical piping and
services is not required.**

2.11 LEAD FLASHING FOR MECHANICAL SERVICES

Lead flashing shall be 4-pound 1.8 kilogram lead conforming to ASTM B 749, Grade B, or 2-1/2-pound, 1.1 kilogram, 6 percent antimonial hard lead of the best commercial grade.

For ordering lead 1 inch 25.4 millimeter thick, weight is 60 pounds per square foot. 293 kilogram per square meter.

PART 3 EXECUTION

3.1 INSTALLATION

Roofing and siding shall be erected in accordance with the approved erection drawings, the printed instructions and safety precautions of the manufacturer.

Sheets shall not be subjected to overloading, abuse, or undue impact. Bent, chipped, or defective sheets shall not be applied.

Sheets shall be erected true and plumb and in exact alignment with the horizontal and vertical edges of the building, securely anchored, and with the indicated rake, eave, and curb overhang.

Work shall be installed to allow for thermal movement of the roofing and siding, movement of the building structure, and to provide permanent freedom from noise due to wind pressure.

Exterior panels of insulated walls shall be installed to provide ventilation of the space between the exterior panel and the insulation.

Weld burns and abrasions due to assembly shall be touched up with the proper finish repair material.

Uncovered edge of the top sheet at sidelaps shall turn down for roofing and turn in for siding and doors.

Roofing sheets shall be laid with corrugations in the direction of the roof slope.

Siding sheets shall be installed with corrugations vertical.

Separate aluminum from contacting dissimilar metals, except zinc and cadmium coatings, with heavy-bodied bituminous coating or resilient gasket.

NOTE: Minimum slope of roofing is assumed to be 3
inches in 12 inches 75 millimeter in 300 millimeter.
When a lesser slope is required, end lap must be
extended.

End laps of exterior roofing sheets shall be not less than 8 inches; 200 millimeter; the side laps of standard exterior corrugated sheets shall be not less than 2-1/2 corrugations and not less than 1-1/2 corrugations for V-beam corrugated sheets.

End laps of exterior siding sheets shall be not less than 6 inches; 150 millimeter; the side laps of external siding sheets shall be not less than two full corrugations for standard corrugated sheets and not less than one and one-half corrugations for V-beam and ribbed corrugated sheets.

3.2 ALIGNMENT OF STRUCTURAL FRAME

Erected structural-steel frame shall be inspected for plumb and true surfaces. Misalignment of framing and erection not in accordance with AISC 335 and ASTM E 621 shall be corrected before commencing installation of roofing and siding.

3.3 WELDING

Procedures for manual, shielded metal-arc welding, the appearance and quality of welds made, and the methods used in correcting welding work shall be in accordance with AWS D1.1/D1.1M.

3.4 FASTENING SYSTEM

[Fastening system shall consist of exposed fasteners of materials and spacing as specified, with applied plastic head caps to match color of specified roofing and siding.]

[Fastening system shall consist of concealed clips and fasteners installed in accordance with the manufacturer's printed instructions.]

3.4.1 Single Sheet, Uninsulated Metal Roofing and Siding

Roofing and siding shall be attached with fasteners of a length to penetrate the support member and extend at least 1/4 inch 6 millimeter on the inside of the member.

[Standard, corrugated, 4- and 8 inch 100 and 200 millimeter fasteners shall be spaced approximately 8 inches 200 millimeter on center at each support and 4 inches 100 millimeter on center at end lap supports. Side lap

fasteners shall be spaced at not more than 12 inches 300 millimeter on center.]

[V-beam roof and side sheet fasteners shall be spaced at approximately 5 inches 125 millimeter on center at end lap supports and 10 inches 250 millimeter on center at intermediate supports. Side lap fasteners shall be spaced at not more than 12 inches 300 millimeter on center.]

[Interlocking side laps shall be fastened by die-clinching at approximately 24 inches 600 millimeter on center for walls and at approximately 12 inches 300 millimeter on center for roofs.]

3.4.2 Sandwich Wall Construction

Temporary self-tapping screws for interior sandwich walls or interior roof panels shall be spaced in sufficient number to securely hold the sheet until the insulation and exterior sheets are installed.

End laps of interior roofing and siding sheets shall be not less than 4 inches. 100 millimeter. Side laps shall be in accordance with the manufacturer's written instructions for the type and profile of the specified sheet.

Interlocking side joints shall be factory calked. Overlap joints shall be sealed with a continuous bead of the specified joint sealant.

[Subgirts shall be installed at indicated spacing but not more than 48 inches 1200 millimeter on center and secured through the interior sheet into steel supports with self-tapping screw fasteners spaced at not more than 8 inches 200 millimeter on center.]

[Subgirts shall be installed at indicated spacing but not more than 48 inches 1200 millimeter on center and secured to the interlocking edge of the interior sheets with self-tapping screw fasteners, fillet welding, or clips, spaced at not more than 12 inches 300 millimeter on center.]

[Insulation shall be placed against the inner sheet and supported on subgirt, butting each insulation board tightly together.]

[Insulation shall be placed between subgirts and interior sheets in accordance with manufacturer's printed instructions, butting each board tightly together, and immobilized by impaling spikes or bolts.]

[Insulation shall be placed between flanges of T-bar and butted tightly against T-bar web to provide a snug fit.]

[Exterior sheets shall be fastened to subgirts with exposed fasteners at the specified spacing.]

[Exterior sheets shall be fastened to subgirts with concealed clips and fasteners spaced in accordance with the manufacturer's printed instructions for roofing and siding installed in a hurricane velocity wind area.]

3.4.3 Metal and Insulation-Faced Construction

Metal and insulation-faced construction shall consist of the specified exterior metal roofing, siding, and rigid insulation board. Insulation shall be installed at right angles to the structural supports and screw-fastened through metal, insulation, and into the support. Fastener

spacing shall be as noted.

Metal and insulation-faced construction shall consist of the specified exterior metal roofing, siding, and rigid insulation board, installed on T-bars and in accordance with the manufacturer's instructions.

3.5 DISSIMILAR METALS

Dissimilar metals, except corrosion-resistant steel and zinc, shall be insulated from each other by painting, or other approved system, as recommended by the roofing and siding manufacturer.

Aluminum shall be insulated from other metals by painting the other metal with one coat of bituminous paint conforming to SSPC Paint 12 cold-applied asphalt mastic to a thickness of at least 1/16 inch. 1.6 millimeter.

Aluminum surface shall be backpainted where it is impractical to paint the other material.

Aluminum surfaces in contact with lime mortar, concrete, or other masonry materials shall be backpainted with a 1/16 inch 1.6 millimeter thick coat of No. 12 asphalt mastic.

3.6 JOINT SEALANTS

Joints shall be made weathertight. Joints of metal roofing shall be sealed. End joints of metal siding, flashing at corners, ridges, eaves, rakes, curbs, and openings in walls and roofs shall be sealed with the specified joint sealant.

Sealing beads shall be continuous, not less than 1/2 inch 13 millimeter in diameter, and applied to ensure a weathertight joint.

3.7 FLASHING AND CLOSURE INSTALLATION

3.7.1 Metal Flashing

Concealed metal flashing shall be installed at heads and sills of openings as indicated, at curbs and holders for closure and filler strips, and formed to the proper profile and thickness.

Exposed metal flashing shall be installed at building corners, jams and sills, rakes and eaves, junctions between metal siding and roofing, valleys and changes of slope or direction in metal roofing, and building expansion joints and gutters. Flashing shall be of thickness and profile shown.

Exposed metal flashing shall be the same material, color, and finish as the specified metal roofing and siding.

Flashing shall be fastened at not more than 8 inches 200 millimeter on center for roofs, and not more than 12 inches 300 millimeter on center for walls, except where flashings are held in place by the same screws that secure covering sheets.

Flashing shall be furnished in at least 8-foot 2.5 meter lengths. Exposed flashing shall have 1 inch 25 millimeter locked and blind-soldered end joints, and expansion joints at intervals of not more than 16 feet. 5 meter.

Expansion joints shall be formed to the profile indicated with end joints

flat-seamed, locked, and soldered, and with free-sliding, sleeve type slip joints at 16-foot 5 meter intervals, designed to allow expansion and contraction and remain weathertight.

Lead flashing shall be installed at openings and pipe projections through metal surfaces, and hammer-formed to the corrugation profile to form an exposed flashing a maximum 6 inches 150 millimeter wide.

Pipe sleeves of the specified metal flashing material shall be installed for pipe and vent projections through metal roofing. Sleeves shall be fastened to roofing with the specified fasteners and flashed with lead flashing.

Exposed flashing and flashing subject to rain penetration shall be bedded in the specified joint sealant.

Flashing in contact with dissimilar metal shall be insulated by means of the specified asphalt mastic material to prevent electrolytic deterioration.

Valley flashing shall have the following minimum widths and joints:

<u>ROOF SLOPE</u>	<u>FLASHING WIDTH</u>	<u>JOINT</u>
Under 4 inches in 12 inches	24 inches	Clinch lock
4 inches in 12 inches to 7 inches in 12 inches	18 inches	Clinch lock
7 inches in 12 inches and over	12 inches	4 inch lap joint
<u>ROOF SLOPE</u>	<u>FLASHING WIDTH</u>	<u>JOINT</u>
Under 100 in 300 millimeter	600 millimeter	Clinch lock
100 in 300 millimeter to 180 in 300 millimeter	460 millimeter	Clinch lock
180 in 300 millimeter and over	300 millimeter	100 millimeter lap joint

Open-valley flashing shall be at least 4 inches 100 millimeter wide at the top, and width shall increase 1/8 inch for each foot 3 in 300 millimeter of length. Flashing shall be fastened at edges only. Open ends of the metal corrugations shall be sealed with the specified mastic closure strips.

Drips shall be formed to the profile indicated, with the edge folded back 1/2 inch 13 millimeter to form a reinforced drip edge.

3.7.2 Closures

Metal closure strips shall be installed at open ends of metal ridge rolls; open ends of corrugated or ribbed pattern roofs, and at intersection of wall and roof unless open ends are concealed with formed eave flashing; rake of metal roof unless open end has a formed flashing member; and in other required areas.

Mastic closure strips shall be installed at intersection of ridge roll with metal roofing; top and bottom of metal siding; heads of wall openings; and in other required locations.

3.8 METAL WAINSCOT

Flat sheet metal wainscot facing shall be provided over exposed sidewall insulation, extended from the floor to height as indicated, and shall connect to girt and finish with a metal closure strip.

Metal sheet shall be fitted between the insulation and behind flanges of the T-bars, and secured in place with the specified sheet metal fasteners spaced at approximately 48 inches 1200 millimeter on center.

3.9 ACCEPTANCE PROVISIONS

3.9.1 Erection Tolerances

Metal roofing and siding shall be erected straight and true with plumb vertical lines correctly lapped and secured in accordance with the manufacturer's written instructions. Horizontal lines shall not vary more than 1/8 inch in 40 feet. 3 millimeter in 12 meter.

3.9.2 Leakage Tests

Finished application of metal roofing and siding shall be subject to inspection and test for leakage by the Contracting Officer. Inspection and tests will be conducted without cost to the Contractor.

Inspection and testing will be made promptly after erection to permit correction of defects and the removal and replacement of defective materials.

3.9.3 Repairs to Finish

Scratches, abrasions, and minor surface defects of finish may be repaired with the specified repair materials. Finished repaired surfaces shall be uniform and free from variations of color and surface texture.

Repaired metal surfaces that are not acceptable to the Contracting Officer shall be immediately removed and replaced with new material.

3.9.4 Paint-Finish Metal Roofing and Siding

Paint-finish metal roofing and siding will be tested for color stability by the Contracting Officer during the manufacturer's specified guarantee period. Tests will be performed by means of groups of 2 inch 50 millimeter metal disks, fastened in exposed areas on all elevations of the building.

Panels that indicate color changes, fading, or surface degradation, determined by visual examination of the test areas after removal of the disks, shall be removed and replaced with new panels at no expense to the Government.

New panels will be subject to the specified tests for an additional year from the date of their installation.
